Excel Assignment 1 – Data Exploration

Project description

The assignment explores a product dataset containing Product ID, Product Name, Brand Name, Price, Quantity and Category. Excel functions are used to summarize product prices, identify minimum and maximum values, classify prices, calculate category-based totals, count low-priced products, and extract date/country components from Product IDs.

Work performed

Task	Formula used	Result
Total of listed product prices	`=SUM(D2:D35)`	$10,100.00
Number of products	`=COUNTA(A2:A35)`	34
Average price	`=AVERAGE(D2:D35)`	$297.06
Minimum price	`=MIN(D2:D35)`	$30.00
Maximum price	`=MAX(D2:D35)`	$1,000.00
Electronics total price	`=SUMIF(F2:F35,"Electronics",D2:D35)`	$8,050.00
Count of prices below $100	`=COUNTIF(D2:D35,"<100")`	11

Formula-based columns added

New column	Formula (row 2 example)	Meaning
Price Range	`=IF(D2>=500,"High Price","Standard Price")`	Classifies prices at the $500 threshold
Day	`=LEFT(A2,2)`	First 2 characters of Product ID
Country Code	`=RIGHT(A2,2)`	Last 2 characters of Product ID
Month	`=MID(A2,4,3)`	Characters 4–6 of Product ID

Key observations and learning outcomes

The dataset contains 34 product records. The sum of the listed unit-price values is $10,100. Electronics account for $8,050 of the listed prices, and 11 products have a price below $100. The average listed price is approximately $297.06. The IF, SUMIF, COUNTIF, LEFT, RIGHT and MID functions provide practice in logical analysis, conditional aggregation and text extraction. The supplied records are retained as provided; no rows have been removed.
